Project details:

- Voting machine
- Laser based security system - It is a type of security and alarm system that uses laser light and light sensor. A security system protects our homes, offices, banks, lockers etc. from intrusion & unauthorized access. A laser security system can act as a standalone system which makes some noise when it detects any irregular activity.
- Block Chains and distributed ledgers - A block chain is originally a growing list of records called blocks. A distributed ledger is a database that is spread across computing devices. Each node replicates and saves an identical copy of the ledger.
- Signature Identification and Authentication using Artificial Neural Network - our system does signature recognition which will be accessed & operated from linux tablets or devices. A neural network once trained can be used as a back end authenticator to which new users can be added or existing users can be verified via signatures. We are using one shot learning to overcome this disadvantage.
